C.T OF THE CHEST P.E & WHOLE ABDOMEN WITH NON IONIC CONTRAST:

Clinical indication: H/O right femoral vein DVT and right thigh swelling.

Axial images were obtained before and after non ionic IV contrast. Oral contrast was also given.

2 mm thick contiguous axial slices were obtained after rapid infusion of non ionic IV contrast.

The main, right and left pulmonary arteries and their branches are well opacified.

There is no evidence of pulmonary embolism.

Patchy consolidation is seen in bilateral lower lobes.

Multiple nodules are seen in both lungs, some of these show cavitations. One of the cavitatory lesion in right upper lobe measures 1.4 x 1.0 cm.

Multiple nodes are seen in the mediastinum. One of them in right paratracheal region measures 1.7 x 1.0 cm.

Partial thrombus is seen in the right femoral vein.

Both common iliac veins and IVC are well opacified by contrast.

Minimal ascites is seen in the pelvis.

Swelling with subcutaneous fat stranding and streaking is seen the right proximal thigh extending into its intramuscular plane representing cellulitis.

Multiple enlarged nodules are seen in bilateral inguinal regions. One on right side measures 1.5 x 1.0 cm.

Findings are likely secondary to infective process with septic embolism.

There is no evidence of mass in either lung.

There is no evidence of pleural effusion on either side.

The bony structures of the chest appear normal.

The liver is of normal size without evidence of any mass.

No evidence of intrahepatic or extrahepatic biliary duct dilatation.

The gall bladder shows normal appearances without evidence of any mass.

The spleen and adrenal glands are normal.

The pancreas is normal without evidence of any mass.

Both kidneys are functioning showing excretion of contrast.

No evidence of mass or hydronephrosis on either side.

The urinary bladder, uterus and pelvic structures are normal.

Degenerative changes are seen in the spine.

CONCLUSION:

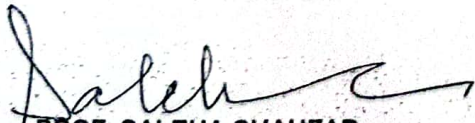

Above described findings are likely secondary to infective process with septic embolism.

There is no evidence of pulmonary embolism.

Partial thrombus is seen in the right femoral vein.

Both common iliac veins and IVC are well opacified by contrast.

Cellulitis is seen in right proximal thigh.

Dengue IgG	Positive
Dengue IgM	Negative

Remarks:

This is a Screening test.

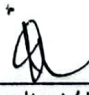

Test performed by Immunochromatography technique (ICT).

The dengue IgG/IgM rapid test device will only indicate the presence of Dengue antibodies in the specimen and should not be used as the sole criteria for the diagnosis of Dengue.

A negative result does not at any time preclude the possibility of dengue infection.
